

Carbon for Marp

A Marp theme based on the IBM Carbon Design System

What's in the box

- Carbon color tokens (white, g10, g90, g100)
- IBM Plex Sans, Serif, and Mono
- Light and dark variants
- Per-slide tonal overrides via `class:`
- CSS variable overrides for any color or font

Typography

Headings use IBM Plex Sans Light (300) at large sizes and Regular (400) for body. Inline `code` and code blocks use IBM Plex Mono.

Good design is good business.
Thomas J. Watson Jr.

Two columns

Use `<!-- _class: split -->` to put the slide into a two-column grid. Headings span both columns.

```
def carbon(theme="white"):
    tokens = load(theme)
    return apply(tokens)

print(carbon("g100"))
```

- Carbon spacing scale
- 64px slide padding
- 4px accent rule on every slide

Dark mode (g100)

Set `<!-- _class: dark -->` on a slide, or use the `carbon-dark` theme for a dark deck by default. Tokens flip to the Carbon g100 palette.

```
type Theme = 'white' | 'g10' | 'g90' | 'g100';  
  
const tokens: Record<Theme, Token[]> = load();
```

Tonal layers

`g10` is the light tonal layer: gray-10 background, white layers. Pair with `g90` on dark decks.

Theme	Background	Text
white	<code>#ffffff</code>	gray-100
g10	<code>#f4f4f4</code>	gray-100
g90	<code>#262626</code>	gray-10
g100	<code>#161616</code>	gray-10

Customizing

Override Carbon tokens via the `style:` directive:

```
---
marp: true
theme: carbon
style: |
  section {
    --carbon-accent: #8a3ffc;
    --carbon-bg: #f4f4f4;
  }
---
```

Nested lists and math

1. Carbon ships four themes

- `white` and `g10` are light
- `g90` and `g100` are dark

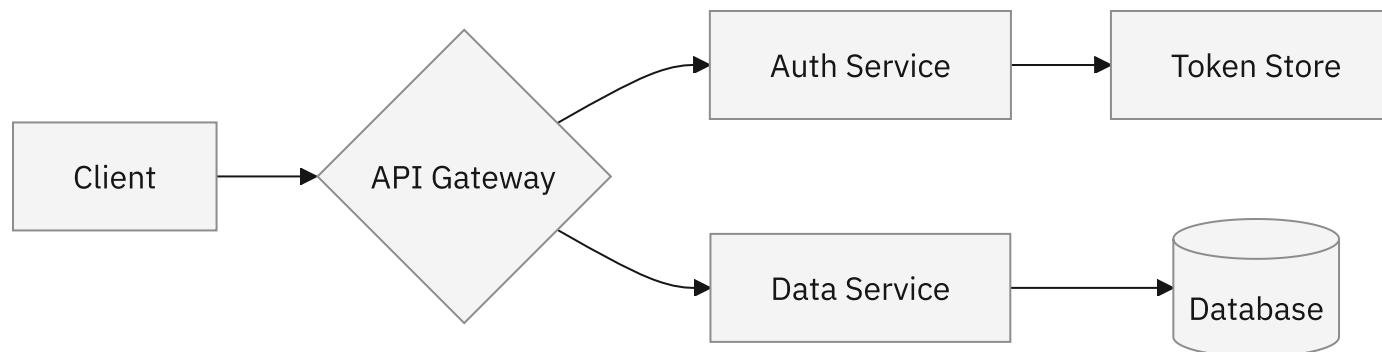

2. Each theme is a set of design tokens

3. Inline math: $E = mc^2$

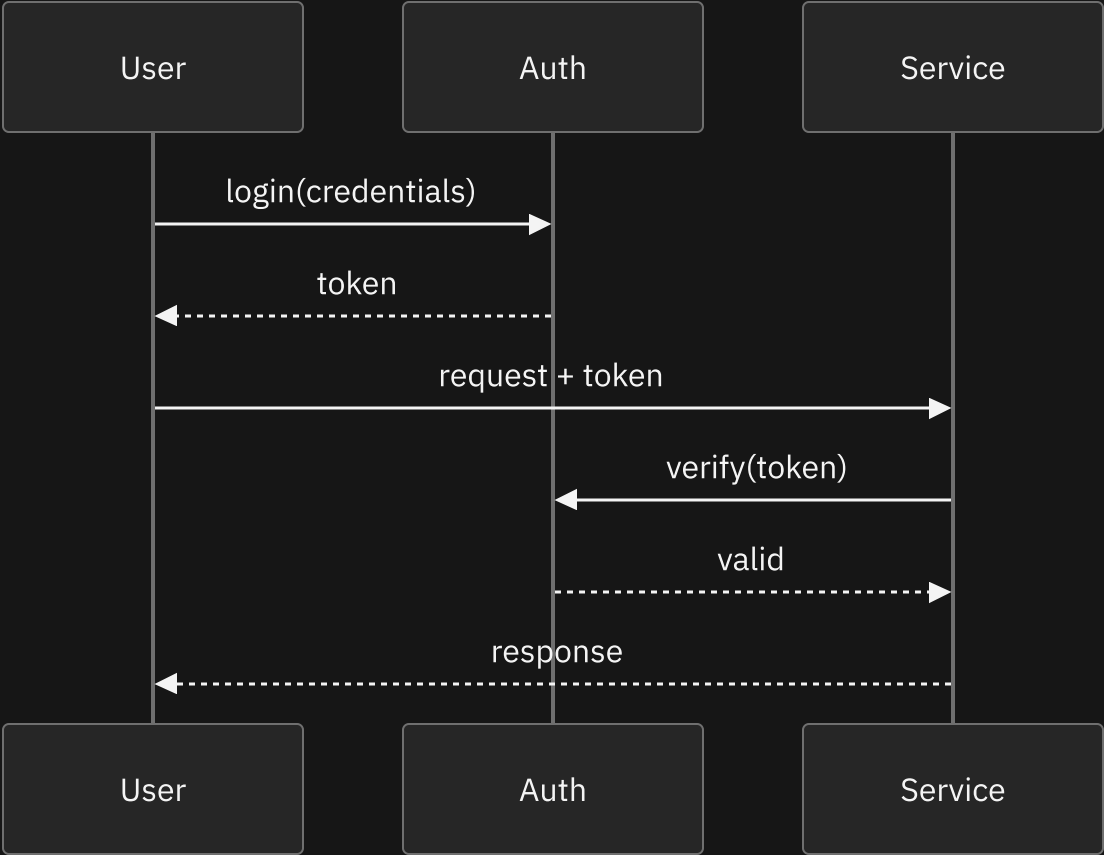

$$\int_{-\infty}^{\infty} e^{-x^2} dx = \sqrt{\pi}$$

Mermaid diagrams

Architecture and flow diagrams use IBM Carbon tokens automatically. Add `<!-- _class: dark -->` and the diagram palette flips to dark tokens.

Mermaid on dark

Three personas

Inline images sized with Marp's `![w:220]` directive. Adam, Antony, Clista — three users we design for.

- `![w:220](adam.png)` — width directive
- `![w:200 h:200](img.png)` — explicit dimensions
- `` — natural size, capped to slide width

Thanks
